

TRACK DIFFERENCES

Both the 200 and 300 series carriages run on Semi-Rigid, Light Weight, Standard and Deep Section profile Track Sections.

The difference between the Semi-Rigid and the Light Weight track, is the fact that the rack is cut into small sections on the Semi Rigid to allow it to flex better.

The weight difference is basically in the extrusions (hardware differences are negligible). For example:

- Deep Section Track 3.6 lb/ft
- Standard Rigid track extrusion is 1.957 lb/ft. (1.643 lb/ft lighter than Deep Section extrusion)
- Semi-Rigid and Light Weight extrusion is 1.344 lb/ft. (0.613 lb/ft lighter than Standard Rigid track extrusion)
